

# Agentic delivery pilot — multi-tenant SaaS

Case sheet · Martin Ždimera · August 2026

**In one sentence:** I built an orchestration framework that lets AI agents deliver a real application stage by stage, with independent review and a human approving each gate — this sheet shows the measured result of its first pilot (my own project).

## Context

A vehicle-fleet damage-documentation product (multi-tenant SaaS: web + PWA, offline-capable). Earlier manual prototyping via AI chat tools stalled: 4 commits in 4 months, non-functional codebase.

## Approach

The same brief was fed into my two-layer agentic orchestration framework: an interactive design phase (gates G0–G3 producing domain model, architecture, safety manifest, API contract and delivery roadmap), followed by a headless delivery loop — per-stage state machine, review by an AI model from a different vendor family than the author ("cross-family review"), deterministic sanity/scope checks, crash-safe resumable state. Human input is limited to gate approvals; an autonomy lock in the framework state enforces this.

*Safety manifest = application-level guardrails (authorization, tenant data boundaries) — not functional safety in the ISO 26262 sense.*

## Evidence — measured from the repository's git history

- **7 delivery stages:** auth/tenancy → fleet → shifts & offline queue → damage reports, photos, notifications → history & dashboard → PDF/Excel export → PWA hardening
- **93 commits, 22 merged pull requests, 14 fix/amendment branches** (self-correction visible in history) in ~5 weeks

- **19,075 lines of application code** (TypeScript/React, Prisma/PostgreSQL, NextAuth, Vercel Blob) + **12,350 lines of tests** in 45 files
- **Human interventions:** design-gate approvals and one approval per stage; no hand-written application code

## Why it matters

---

This is governed delivery, not "AI wrote a script": design authority separated from implementation, independent cross-vendor review, auditable state. The same control pattern is what I'd apply to IaC, migrations, documentation and compliance-checked automation — and it is the workflow demonstrated live in Block 1 of the proposed workshop.
